

46TH ANNUAL CONFERENCE

PROCEEDINGS

American Association of Bovine Practitioners

Milwaukee, Wisconsin
September 19-21, 2013

Raise your expectations.

Dairying means bringing your best to the barn everyday. Estrumate® (cloprostenol sodium) is here to help you do just that. Use AI more conveniently, control breeding and calving intervals and schedule the entry of heifers into the milking herd.

And with Dairy Care365™, you have the value-added services, programs and advocacy initiatives to help you achieve the next level of success. That's our responsibility.

Talk to your Merck Animal Health representative about Estrumate.

The Science of Healthier Animals.™

At 50 and 100 times the recommended dose, mild side effects may be detected in some cattle; these include increased uneasiness, slight frothing, and milk let-down. For complete information on use, withdrawal period, contraindication, adverse reactions, refer to product package insert on page viii.

PROCEEDINGS
of the
FORTY-SIXTH ANNUAL CONFERENCE
AMERICAN ASSOCIATION OF BOVINE PRACTITIONERS

September 19-21, 2013

Parliamentarian.....Rich Meiring, DVM, Mississippi State, Mississippi
AVMA DelegateMark Spire, DVM, Manhattan, Kansas

Table of Contents

GENERAL SESSIONS

• Help consumers hear what you say Mike Opperman	1
• “Moneyball”: A new approach to practice; building the perfect team and prioritizing problems in dairy herds Gustavo M. Schuenemann, Santiago Bas, Jeffrey D. Workman	3
• Scenarios of the future: The evolving veterinary practice Jim Austin.....	10
• Beef practice model: One practice’s perspective and view forward Arn Anderson	15

BEEF SESSIONS

• How we use the BQA feedyard welfare assessment as an educational tool David Sjeklocha	19
• Reasonable expectations for antibiotics in feedyards Michael D. Apley	22
• Judicious use of antimicrobials in the feedyard David Sjeklocha	30
• Production records in cow-calf operations John Bolinger	32
• Livestock stewardship: “Pregnancy checking, why should we recommend it?” GL Stokka, Rob Maddock, Carl Dahlen, Tim Petry, Charlie Stoltzenow	34
• Current concerns about veterinary product use and cow-calf fertility Bob L. Larson.....	36
• Pre-weaning pneumonia in cow-calf herds: Field investigations Russell F. Daly	39
• BRD in preweaned calves: What’s new in risk factors? Amelia R. Woolums	45

DAIRY SESSIONS

• Animal Medicinal Drug Use Clarification Act, extralabel drug use, and residue avoidance Virginia R. Fajt.....	49
• A dairy producer’s perspective on managing drug and antibiotic use in dairy animals Leon D. Weaver.....	55
• Practical pharmacology for the field Michael D. Apley	60
• Antibiotic decision making – calf scours Geof W. Smith.....	65
• Antibiotic treatments for bovine mastitis: Who, what, when, how and why? Pamela L. Ruegg	72
• Group-housed feeding systems for dairy calves Mark J. Thomas, Michael Capel	80
• From pasture to package: How one farm family reached for the retail dollar Charles W. Hatcher.....	83
• “Value added veterinarians”: The future of veterinary services in direct farm marketing Charles W. Hatcher.....	85
• Milk payment systems in the United States John Geuss	87

• Milk quality services for dairy farms Andrew P. Johnson	93
--	----

AABP-AASRP JOINT SESSIONS

• NCIS: Nematode criminal investigation service Lisa H. Williamson.....	96
• Fecal fluency: A review of fecal tests and how to interpret the results Lisa H. Williamson.....	102
• Put your money where your mouth is: How to develop an effective management program for large sheep and goat herds with a limited budget Andrea Mongini	107
• Using your skills as a herd management consultant: A veterinarian’s role beyond the blocked pygmy goat Andrea Mongini	110
• Developing large, disease free herds: how to help producers start or grow operation with success Andrea Mongini	112
• Are goats really just small cows? How a cattle veterinarian can use their skills for small ruminants Andrea Mongini	115
• Common health challenges for small-scale sheep and goat herds Joan S. Bowen	116
• Improving client profitability by increasing veterinary services in the sheep and goat production cycle Joan S. Bowen	123

VETERINARY TECHNICIAN SESSIONS

• Milk bacteriology: Basics and pitfalls R.J. Erskine	127
• Sample submissions to a diagnostic laboratory Sharon L. Clowser	131

RESEARCH SUMMARIES I

• Changes in rectal temperature, sacrosciatic ligament relaxation, and plasma progesterone concentration 24 hours before parturition in Holstein-Friesian cattle M.W.H. Hiew, A. Megahed, J.R. Townsend, L.A. Horstman, P.D. Constable.....	133
• Association between calving difficulty score and intrapelvic dimensions, calf hoof circumference, and calf birth weight in Holstein-Friesian cattle M.W.H. Hiew, A. Megahed, L.A. Horstman, P.D. Constable.....	134
• Validation of two diagnostic methods for postpartum endometritis in dairy cows J. Denis-Robichaud, J. Dubuc.....	135
• Evaluation of ampicillin trihydrate for treatment of metritis and subsequent fertility in lactating dairy cows F.L Lima, A. Vieira-Neto, N.M. Martinez, C.A. Risco, K.N. Galvão, J.E.P. Santos.....	136
• Effect of induced subclinical hypocalcemia (SCH) on dry matter intake, energy status, and immune-cell function in dairy cows N. Martinez, C.A. Risco, L.D.P. Sinedino, R.S. Bisinotto, J.P. Driver, J.E.P. Santos	137

• Randomized clinical field trial on the effects of butaphosphan-cyanocobalamin and propylene glycol on ketosis resolution and milk production in dairy cows J.L. Gordon, T.F. Duffield, D.F. Kelton, T.H. Herdt, L. Neuder, S.J. LeBlanc	139
• Economic considerations for subclinical ketosis in lactating dairy cattle K. G. Gohary, S. J. LeBlanc, K. D. Lissemore, M. Von Massow, M. W. Overton, T. F. Duffield	141
• Evaluation of the CARDY Potassium Meter as a point-of-care instrument for measurement of plasma and blood potassium concentrations in cattle A. A. Megahed, M.H. Hiew, P.D. Constable.....	142
• The effects of BRD in Holstein dairy calves during the first 120 days of life on subsequent production, longevity, and reproductive performance as cows A.P. Schaffer, S.J. Bartle, R.L. Larson, D.U. Thomson.....	143
• Comparison of the metaphylactic efficacy of gamithromycin, tilmicosin and tulathromycin in beef calves at high risk for BRD T.J. Miller, D.U. Thomson, C.D. Reinhardt, C.A. Loest, M.E. Hubbert	144
• Comparison of thoracic ultrasonography with analysis of bronchoalveolar lavage fluid for the diagnosis of subclinical bronchopneumonia in dairy calves T.L. Olivett, D. F. Kelton, D. V. Nydam, J. Caswell, J. Hewson, T. F. Duffield, Ken Leslie	145
• Ultrasonographic progression of lung consolidation after experimental infection with <i>Mannheimia haemolytica</i> in Holstein bull calves T. L. Olivett, J. Hewson, R. Shubotz, J. Caswell.....	147
• Pulmonary lesions and clinical disease response to <i>Mannheimia haemolytica</i> challenge 10 days following administration of tildipirosin or tulathromycin D.E. Amrine, B.J. White, R.L. Larson, D.A. Mosier	148
• Effects of dietary grain content on performance and morbidity of newly received beef heifers C. J. Redding, D. U. Thomson, J. S. Schutz, S. J. Bartle, C. D. Reinhardt, M. E. Hubbert	149
RESEARCH SUMMARIES II	
• A novel approach to bovine viral diarrhea virus surveillance M.D. Givens, M.S.D. Marley, K.P. Riddell, YiJing Zhang	150
• Bovine viral diarrhea virus transmission from persistently infected cattle to non-persistently infected cattle when commingled: an evaluation of serum neutralizing antibody titers K.A. Foster, R.A. Hesse, L. Peddireddi, R.D. Oberst, E.G. Poulsen, D.U. Thomson.....	151
• Assessment of vaccine efficacy in early-weaned beef calves challenged with bovine viral diarrhea virus (BVDV) Manuel F. Chamorro, Paul H. Walz, Thomas Passler, Soren Rodning, Julie Gard, Kay Riddell.....	152
• Association of bovine leukemia virus and <i>Mycobacterium avium</i> subsp <i>paratuberculosis</i> with shedding of Shiga toxin-producing <i>Escherichia coli</i> (STEC) C. Venegas-Vargas, P. Bartlett, P. Coussens, S.D. Manning, D. Grooms	154
• Prevalence of <i>Mycobacterium avium</i> subsp <i>paratuberculosis</i> (MAP) ELISA-positive cows and assessment of MAP transmission risk on organic dairy farms in Ontario, Canada L. Pieper, A. Godkin, U.S. Sorge, K.D. Lissemore, T.J. DeVries, D.F. Kelton	156
• Association between risk assessment scores and lactating cow <i>Mycobacterium avium</i> subsp <i>paratuberculosis</i> ELISA results on Ontario dairy farms L. Pieper, A. Godkin, U. S. Sorge, K.D. Lissemore, T.J. DeVries, D.F. Kelton	158
• Interpretation of repeated testing for <i>Mycobacterium avium</i> subsp <i>paratuberculosis</i> on Ontario dairy herds D.F. Kelton, M.A. Godkin, J. Fairles, S. Roche, D. van de Water	159
• Relationship between uterine pathology and depletion of oxytetracycline concentrations in plasma and milk after intrauterine infusion P.J. Gorden, J.F. Coetzee, C.J. Lee, L.W. Wulf	161
• Does digital dermatitis cause hoof conformation changes in its early clinical stage? A. Gomez, N. Cook, K. Cooley, K. Dumbar, J. Rieman, D. Dopfer.....	162
• Evaluation of monthly individual cow somatic cell count data to predict the risk of exceeding a bulk-tank somatic cell count threshold of 400,000 c/mL V. Fauteux, J.-P. Roy, Émile Bouchard, Daniel Scholl, Denis Haine	163
• Pharmacokinetics of intravenous and oral firocoxib in preweaned calves and evaluation of perioperative analgesia following cauterization Matthew L. Stock, Ronette Gehring, Suzanne T. Millman, Laura A. Barth, Larry W. Wulf, Johann (Hans) F. Coetzee	164
• Behavioral response of feedlot cattle following tail docking L.K. Kroll, D.L. Grooms, J.S. Siegfried	165
• Impact of livestock production type vaccination priority order on the control of a foot and mouth disease outbreak in the central United States S.W. McReynolds, M.W. Sanderson	166
• Impact of uncertainty in foot and mouth disease indirect transmission probability on outbreak duration and number of herds depopulated S.W. McReynolds, M.W. Sanderson	167
RESEARCH SUMMARIES III	
• Dairy cow well-being on large, high-performance Wisconsin dairy herds R.L. Brotzman, D.D. Döpfer, M.R. Foy; J.P. Hess, K.V. Nordlund, T.B. Bennett, N.B. Cook	168
• Impact of disease on individual culling risk and herd culling rate in dairy cattle D. Haine, J. Carrier, R. Cue, A. Sewalem, K. Wade, J. Arsenault, E. Bouchard, J. Dubuc	169
• The influence of different nutritional planes in the dry period on immunoglobulin G concentration of bovine colostrum S. Mann, F. Leal Yepes, T. R. Overton, D. Nydam	170
• Effect of feeding colostrum that was heat-treated with the Perfect Udder® System on passive transfer of immunoglobulin G in neonatal Jersey calves A.A. Kryzer, S.M. Godden, R. Schell	171
• Comparison of gastrointestinal parasites and management practices between organic and conventional dairy herds in Minnesota S.L. Schroth, B.E. Stromberg, B.J. Heins, J.E. Lombard, D.F. Kelton, U.S. Sorge	172

• Assessment of events occurring during the previous lactation, the dry period, and peripartum as risk factors for early lactation mastitis in cows administered different intramammary dry-cow treatments	P.J. Pinedo, C. Fleming, C.A. Risco	173
• Evaluation of udder health parameters of organic and conventional dairy herds in Minnesota	L.J. Michels, S.M. Godden, B.J. Heins, J.E. Lombard, U.S. Sorge	174
• Evaluation of the API® 20 Strep system for identification of <i>Lactococcus lactis</i> subspecies <i>lactis</i> isolated from bovine milk samples	M. M. Barrett, D. V. Nydam, B. Moslock Carter, M.E. Charter, D. Burnett, J. Adamchick	175
• Impact of milk feeding levels and housing on the incidence of respiratory disease in young dairy calves	P.D. Krawczel, M.E. Prado, J. Wilkerson	176
• A survey of veterinarians in six states in the US regarding their experience with nursing beef calf respiratory disease	Amelia R. Woolums, Roy D. Berghaus, David R. Smith, Brad J. White, Terry J. Engelken, Max B. Irsik, Darin K. Matlik, A. Lee Jones, Isaiah J. Smith	177
• Randomized longitudinal study to test the effect of pre-calving vaccination of range beef cows and other factors on the incidence of calf pneumonia	D.R. Smith, A.R. Woolums, D.M. Grotelueschen, L.E. Thompson, T. Noffsinger, G.L. Stokka, J. Maddux, H. Hill, L. Rowley	179
• Assessment of L-lactatemia as a predictor of bovine respiratory disease incidence and severity in feedlot steers	S. Buczinski, R. Rademacher, M. Edmonds, H. Tripp, EG Edwards	180
• Use of thoracic ultrasonography for the evaluation of lung pathology in beef cattle with acute bovine respiratory disease	Ryan Rademacher, Sébastien Buczinski, Matthew Edmonds, Holt Tripp, Edward Johnson	181
• Effect of surgical castration at different stages of maturity with or without analgesia on growth performance and acute-phase response	J.G. Powell, H.D. Hughes, J.T. Richeson, E.B. Kegley, N.C. Burdick Sanchez, J.A. Carroll	182

RESEARCH SUMMARIES IV

• Clinical study to assess the level of unconsciousness in cattle following the administration of high doses of xylazine hydrochloride	R. D. Dewell, L.L. Bergamasco, C. K. Kelly, J. K. Shearer, G. A. Dewell	183
• Survival of dairy cattle following treatment of idiopathic pericardial hemorrhage with parenteral dexamethasone or isofluprednone acetate	J.M. Gaska, S.M. McGuirk, S.F. Peek	184
• Genomic variation in innate immunity and susceptibility to uterine diseases in Holstein cows	P.J. Pinedo, K.N. Galvao, C.M. Seabury	185
• Role of veterinary practitioners in industry-led dairy health and quality programs in Ontario	M.A. Godkin, G. MacNaughton, K. Barratt, C. Church, D. Kelton	187
• Understanding dairy employee attitudes, concerns, and perspectives to improve employee management and overall herd health	P.T. Durst, S.J. Moore, F.D. Soriano	188
• Intra-farm communication about calf health: who's talking?	D.A. Moore, W.M. Sischo, M.A. Davis, J. Vanegas, R. Pereira, L. Warnick	189
• Comparison of beta-hydroxybutyrate determination by Fossomatic milk analysis to milk and blood tests in postpartum dairy cattle	D.J. Wilson, G.M. Goodell	191
• An economic analysis of subclinical ketosis testing and propylene glycol treatment strategies in early lactation dairy cattle	J.A.A. McArt, D.V. Nydam, P.A. Ospina, G.R. Oetzel, C.L. Guard	193
• Evaluation of the respective relationships between rumination time within the first 10 days in milk and periparturient diseases, subclinical hypocalcemia, negative energy balance, and milk production in dairy cows	P.A. Ospina, D.V. Nydam, L.S. Caixeta	194
• Dynamics of body condition score, ultrasound measured backfat, and body weight during the transition period of dairy cows and their association with milk production in herds with automatic milking systems	L.S. Caixeta, P.A. Ospina, M. Capel, D.V. Nydam	196
• The association of dystocia and metritis with daily activity patterns of Holstein dairy cows	M. Titler, M.G. Maquivar, S. Bas, E. Gordon, P.J. Rajala-Schultz, G.M. Schuenemann	197
• A scoping review of the peer-reviewed literature in human populations and <i>in vitro</i> for potential non-antimicrobial interventions to reduce antimicrobial resistance in cattle	V.R. Fajt, C.P. Murphy, P. Wickwire, M.J. Foster, S.A. McEwen, H.M. Scott	198
POSTERS		
• Performance of an IDEXX Bovine Pregnancy Test adapted for visual-read results and designed for in-clinic use	A. M. Rice, M.J. Fabbricante, S.I. Koller, L. Lemieux, P. Welles, S. Leterme	199
• Application of the Bovine Milk Pregnancy ELISA in beef cows	J.N. Roberts, D.L. Grooms, T.M. Byrem	200
• The prevalence of <i>Tritrichomonas foetus</i> in cull cows at a southeastern abattoir	L Jones, R Palomares, S Rajeev, D Ensley	201
• Bovine leukemia virus in Michigan beef bulls	J. Zalucha, D.L. Grooms, R. Erskine, B. Norby, P. Coussens, P. Bartlett	202
• A simulation model to determine the economic value of changing diagnostic characteristics for identifying bovine respiratory disease	M.E. Theurer, B.J. White, R.L. Larson, T.C. Schroeder	203
• Effect of ambient temperature on viral replication and serologic titers following administration of a commercial intranasal modified-live IBR/PI-3 vaccine in beef cattle housed in high and low ambient temperature environments	G.P. Grissett, B. White, D.E. Anderson, R. Larson, M. Miesner	204
• Evaluation of behavioral changes in cattle using three-dimensional accelerometers during experimental infection with bovine viral diarrhea virus	J.E. Bayne, T. Passler, B.J. White, M.E. Theurer, E. van Santen, P.H. Walz	205
• Comparison of thoracic auscultation, clinical score, and ultrasonography as indicators of bovine respiratory disease in pre-weaned dairy calves	S. Buczinski, G. Forté, D. Francoz, A.M. Bélanger	207

Notice to Readers

Articles published in the Proceedings of the American Association of Bovine Practitioners are not peer-reviewed or refereed. All statements, opinions and conclusions contained in articles in the Proceedings are those of the author(s), and are not necessarily those of the American Association of Bovine Practitioners (AABP) unless specifically approved by the AABP Board of Directors.

Estrumate®

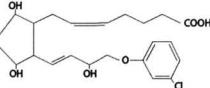

(cloprostenol sodium)

Prostaglandin Analogue for Cattle

Equivalent to 250 mcg cloprostenol/ml.

US 3686/1
F-30510615
USA067796N v

Estrumate® (cloprostenol sodium) is a synthetic prostaglandin analogue structurally related to prostaglandin F₂α (PGF₂α). Each ml. of the colorless aqueous solution contains 253 mcg of cloprostenol sodium (equivalent to 250 mcg of cloprostenol) in a sodium citrate, anhydrous citric acid and sodium chloride buffer containing 0.1% w/v chlorocresol bp as a bactericide. pH is adjusted, as necessary, with sodium hydroxide or citric acid.

ACTION:

Estrumate causes functional and morphological regression of the corpus luteum (luteolysis) in cattle. In normal, nonpregnant cycling animals, the effect on the life span of the corpus luteum usually results in estrus 2 to 5 days after treatment. In animals with prolonged luteal function (pyometra, mammified fetus, and luteal cyst), the induced luteolysis usually results in resolution of the condition and return to cyclicity. Pregnant animals may abort on the stage of gestation.

INDICATIONS:

For intramuscular use to induce luteolysis in beef and dairy cattle. The luteolytic action of Estrumate can be utilized to manipulate the estrus cycle to better fit certain management practices, to terminate pregnancies resulting from inseminations, and to treat certain conditions associated with prolonged luteal function.

RECOMMENDATIONS:

Unmammified or nonmammified fetus

Cows which are not detected in estrus, although ovarian cyclicity continues, can be treated with Estrumate if a mature corpus luteum is present. Estrus is expected to occur 2 to 5 days following injection, at which time animals may be inseminated. Treated cattle should be inseminated at the usual time following detection of estrus. If estrus detection is not desirable or possible, treated animals may be inseminated twice at about 72 and 96 hours postinjection.

Pyometra or Chronic Endometritis

Damage to the reproductive tract at calving or postpartum retention of the placenta often leads to infection and inflammation of the uterus (endometritis). Under certain circumstances, this may progress into chronic endometritis with the uterus becoming distended with purulent matter. This condition, commonly referred to as pyometra, is characterized by a lack of cyclical estrus behavior and the presence of a persistent corpus luteum. Induction of luteolysis with Estrumate usually results in evacuation of the uterus and a return to normal cyclical activity within 14 days after treatment. After 14 days posttreatment, recovery rate of treated animals will not be different than that of untreated cattle.

Mummified Fetus

Death of the conceptus during gestation may be followed by its degeneration and dehydration. Induction of luteolysis with Estrumate usually results in expulsion of the mummified fetus from the uterus. (Manual assistance may be necessary to remove the fetus from the vaginal. Normal cyclical activity usually follows.)

Luteal Cyst

A cow may be noncyclic due to the presence of a luteal cyst (a single, anovulatory follicle with a thickened wall) which is accompanied by no external signs and by no changes in palpable consistency of the uterus. Treatment with Estrumate can restore normal ovarian activity by causing regression of the luteal cyst.

Pregnancies from Insemination:

Unmammified cattle can be safely and efficiently terminated from 1 week after mating and about 5 months of gestation. The induced abortion is nonhemorrhagic and the fetus and placenta are usually expelled about 4 to 5 days after the injection with the reproductive tract returning to normal soon after the abortion. The ability of Estrumate to induce abortion decreases beyond the fifth month of gestation while the risk of dystocia and its consequences increases. Estrumate has not been sufficiently tested under field conditions; therefore, recommendations cannot be made for its use in heifers placed in heat.

Controlled Breeding

The luteolytic action of Estrumate can be utilized to schedule estrus and ovulation for an individual cycling animal or a group of animals. This allows control of the time at which cycling cows or heifers can be bred. Estrumate can be incorporated into a controlled breeding program by the following methods:

- 1. Single Estrumate injection: only animals with a mature corpus luteum should be treated to obtain maximum response to the single injection. However, all cycling cattle should be treated since a mature corpus luteum is present for only 11 to 12 days of the 21-day cycle.

Prior to treatment, cattle should be examined rectally and found to be anesthetically normal, be nonpregnant, and have a mature corpus luteum. If these criteria are met, estrus is expected to occur 2 to 5 days following injection, at which time animals may be inseminated. Treated cattle should be inseminated at the usual time following detection of estrus. Estrus detection is not desirable or possible; treated animals may be inseminated either once at about 72 hours or twice at about 72 and 96 hours post injection.

With a single injection program, it may be desirable to assess the cyclicity status of the herd before Estrumate treatment. This can be accomplished by heat detecting and breeding at the usual time following detection of estrus for a 1-day period, all prior to injection.

If the sixth day the cyclicity status appears normal (approximately 25%-30% detected in estrus), all cattle not already inseminated should be palpated for normality, nonpregnancy, and cyclicity, then injected with Estrumate. Breeding should then be continued at the usual time following signs of estrus on the seventh and eighth days. On the ninth and tenth days, breeding may continue at the usual time following detection of estrus, or all cattle not already inseminated may be bred either once on the ninth day (at about 72 hours postinjection) or on both the ninth and tenth days (at about 72 and 96 hours post injection).

2. Double Estrumate injection: prior to treatment, cattle should be examined rectally and found to be anesthetically normal, nonpregnant, and cycling (presence of a mature corpus luteum is not necessary when the first injection of a double injection program is given). Animals not inseminated should receive a second injection 11 days after the first injection. In normal, cycling cattle, estrus is expected 1 to 3 days following the second injection. Treated cattle should be inseminated at the usual time following detection of estrus. If estrus detection is not desirable or possible, treated animals may be inseminated either once at about 72 hours or twice at about 72 and 96 hours following the second Estrumate injection.

Many animals will come into estrus following the first injection; these animals can be inseminated at the usual time following detected estrus. Animals not inseminated should receive a second injection 11 days after the first injection. Animals receiving both injections may be inseminated at the usual time following detection of estrus or may be inseminated either once at about 72 hours or twice at about 72 and 96 hours post second injection.

Any controlled breeding program recommended above must be completed by either:

- observing animals (especially during the third week after injection) and inseminating or hand mating any animals returning to estrus,
- or
- turning in dead-up bulls(s) 5 to 7 days after the last injection of Estrumate to cover any animals returning to estrus.

REQUIREMENTS FOR CONTROLLED BREEDING PROGRAMS:

A variety of programs can be designed to best meet the needs of individual management systems. A controlled breeding program should be selected which is appropriate for the existing circumstances and management practices.

Before a controlled breeding program is planned, the producer's objectives must be examined and he must be made aware of the projected results and limitations. The producer and his consulting veterinarian should review the operation's breeding history, herd health, and nutritional status and agree that a controlled breeding program is practical in the producer's specific situation. For any successful breeding program:

- cows and bulls must be normal, nonpregnant, and cycling (rectal palpation should be performed);
- cattle must be in a fit and thrifty breeding condition and on an adequate or increasing plane of nutrition;
- proper program planning and record keeping are essential;
- if artificial insemination is used, it must be performed by competent inseminators using high-quality semen.

It is important to understand that Estrumate is effective only in animals with a mature corpus luteum (ovulation must have occurred at least 5 days prior to treatment). This must be considered when breeding is intended following a single Estrumate injection.

SAFETY AND TOXICITY:

At 50 and 100 times the recommended dose, mild side effects may be detected in some cattle. These include increased uneasiness, slight flushing, and milk let-down.

CONTRAINdications:

Estrumate should not be administered to a pregnant animal whose calf is not to be aborted.

PRECAUTIONS:

There is no effect on fertility following the single or double dosage regimen when breeding occurs at induced estrus or at 72 and 96 hours posttreatment. Conception rates may be lower than expected in those fixed time breeding programs which omit the second insemination (i.e., the insemination at or near 96 hours). This is especially true if a fixed time insemination is used following a single Estrumate injection. As with all parenteral products, careful aseptic techniques should be employed to decrease the possibility of postinjection bacterial infection. Antibiotic therapy should be employed at the first sign of infection.

DOSAGE AND ADMINISTRATION:

Two ml. of Estrumate (500 mcg of cloprostenol) should be administered by INTRAMUSCULAR INJECTION for all indications in both beef and dairy cattle. Do not puncture stopper more than 10 times.

WARNINGS:

For veterinary use only.

Women of childbearing age, asthmatics, and persons with bronchial and other respiratory problems should exercise extreme caution when handling this product. In the early stages, women may be unaware of their pregnancies. Estrumate is readily absorbed through the skin and may cause abortion and/or bronchospasm; direct contact with the skin should therefore be avoided. Accidental spillage on the skin should be washed off immediately with soap and water.

STORAGE CONDITIONS:

1. Protect from light.
2. Store in container.
3. Store at controlled room temperature 59°-86°F (15°-30°C).

HOW SUPPLIED:

20ml. and 100ml. multidose vials

CAUTION:

Federal USA law restricts this drug to use by or on the order of a licensed veterinarian.

Made in Germany.
