-NOTES-

For the price of postage alone, you can find out if your large animal clients suffer from selenium or copper deficiencies.

Last year, Schering initiated free blood testing for selenium deficiencies. Now we've extended that offer to include tests for copper deficiencies. And quicker results.

As makers of the only injectable vitamin-mineral supplements — MU-SE,[®] BO-SE,[®] E-SE,[®] L-SE,[®] and Molycu,[®] Schering is concerned about selenium and copper deficiencies in large animals. And you should be too.

Goats, horses, llamas, you name it.

Both selenium and copper deficiencies are widespread and

contribute to such conditions as abortions, muscle degeneration, weak or premature calves, white muscle disease and general unthriftiness. Yet where these deficiencies exist they can easily be remedied with the help of Schering's selenium and copper injectable supplements.

Selenium/Copper Testing... Not only free, but easy.

Just send us a 4-5 ml sample of heparinized whole blood per animal for selenium analysis or 5 cc's of serum for copper analysis — maximum 10 animals per herd. Our new and expanded lab now provides ample facilities for both selenium and copper testing, and quicker results as well. (You can

expect to have your results in just three weeks).
